

PROJECT MANAGEMENT

Global Energy provides PMC project management consultant services to manage CAPEX capital investments in oil, gas and energy projects on behalf of asset holders. On request we can also provide experienced and qualified consultants and engineers to execute project management tasks in oil and gas, oil refining, petrochemicals and power generation industries worldwide.

REFINED PROJECT MANAGEMENT CONSULTANTS

Managing the interests of CAPEX energy projects plant owners is one of our fundamental services. We have supported owner-operated companies for many years, assisting engineering contractors performing PMC project management consultancy with seconded Global Energy engineers and consultants.

Engineering and design

Our qualified senior engineers have been called on to execute project management services in engineering/design phase tasks during basic/detailed engineering and CAD design, including checking material and equipment specifications, requisitioning, bid evaluations, data sheet specifications and process calculations.

Construction management

We have provided services to owner operators as client representatives, providing construction management support under the project management consultant umbrella. Leading EPC managing contractors have also engaged Global Energy for support within this discipline. Construction management services are offered including materials management, field engineering support, and welding inspection and verification. Supervision can be carried out for electrical aspects, as well as for instrumentation, DCS, civil and structural, mechanical, static and rotating matters and through to mechanical completions and turnover.

Project controls management

Apart from engineering and design and construction management, PMC services need to be covered in terms of project controls management. Our highly qualified staff can support projects in the very diverse fields of contract management, procurement, planning, cost control, and QA/QC and HSE safety engineering.
